

Likely Post-Covid-19 Challenges for Older People

Professor Hafiz T.A. Khan

College of Nursing, Midwifery and Healthcare, University of West London, UK

Symposium on

Ageing People and Society

Organised by Turkish National Commission for UNESCO

22 March 2021, Turkey

Outline of talk

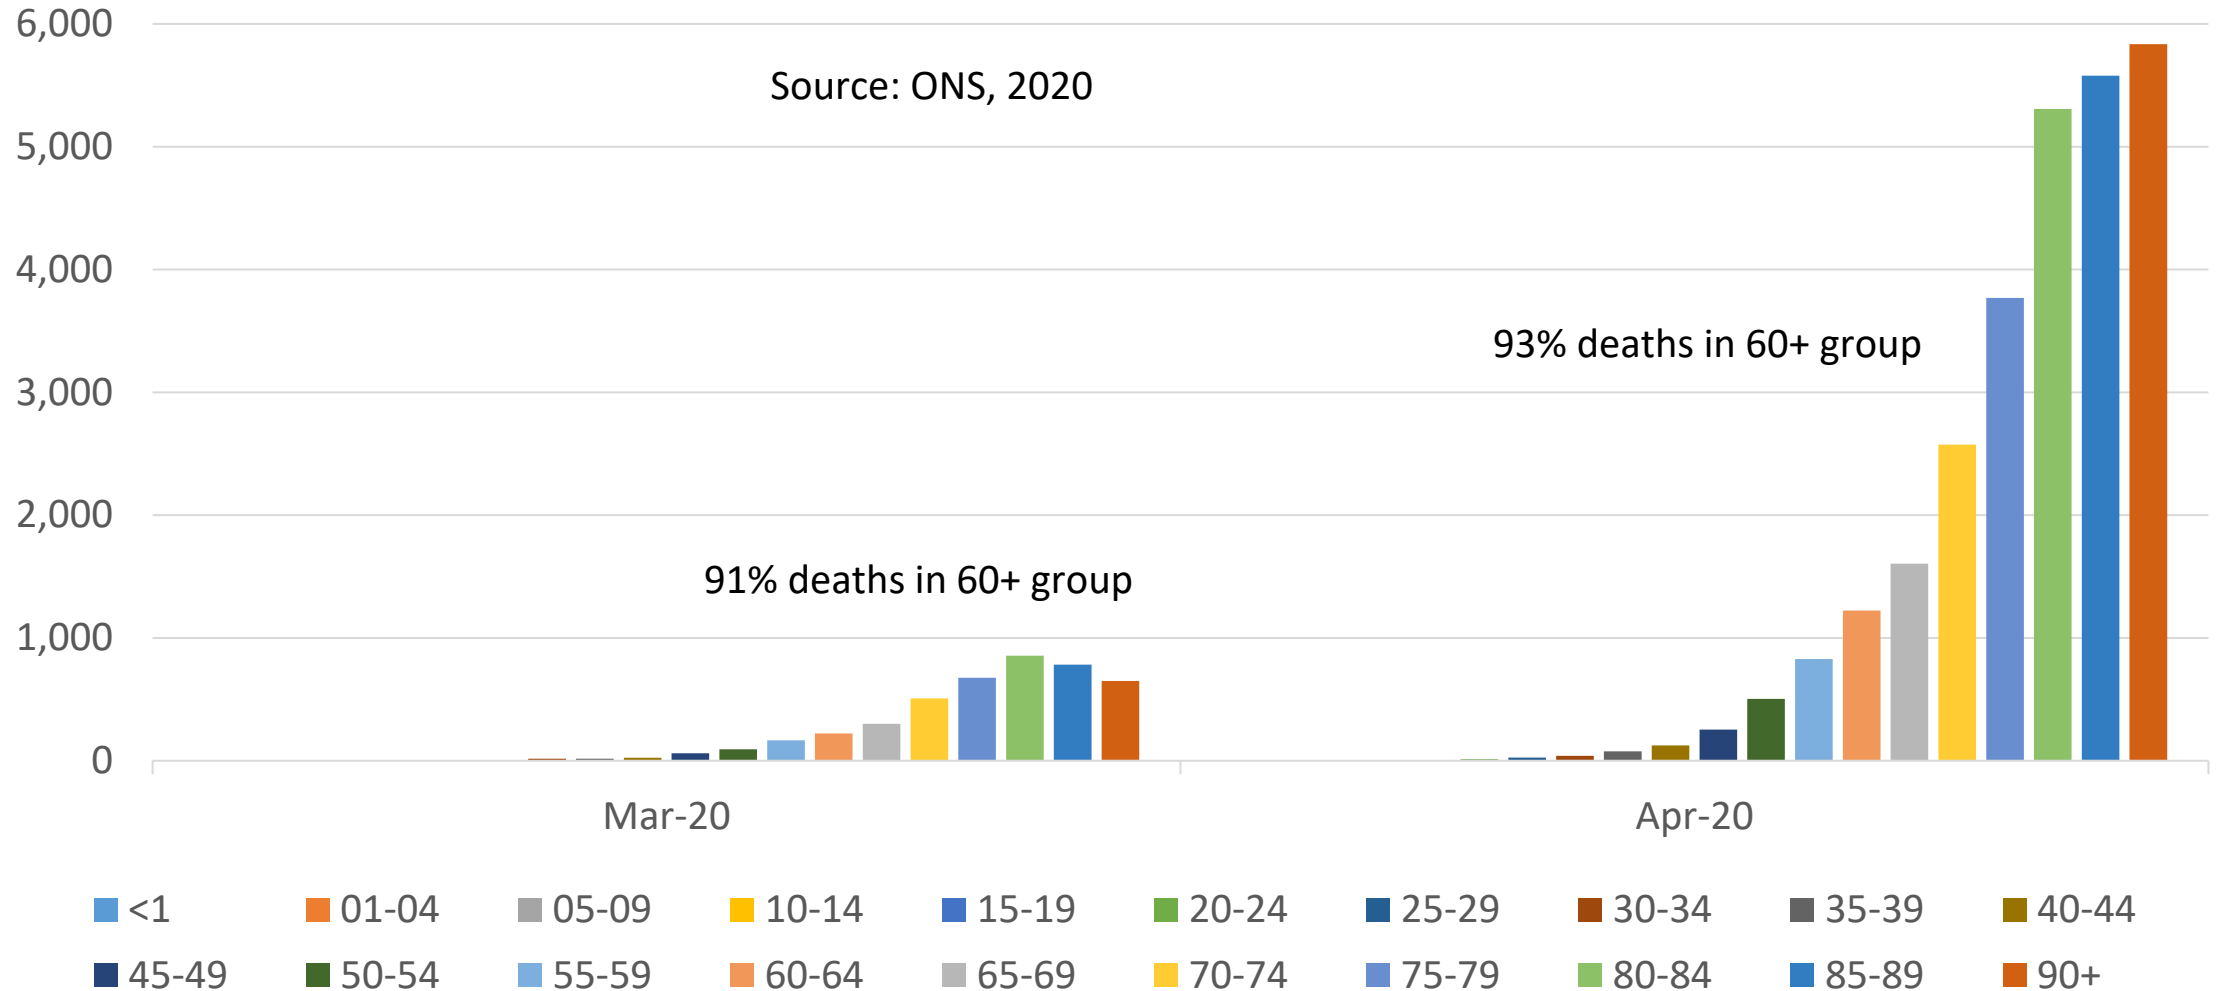

- Deaths in older people due to COVID-19.
- Lessons learned from COVID-19 to safeguard older people within existing health system.
- Likely future challenges for older people in society.

COVID-19 affects everyone today

COVID-19 pandemic affects all segments of the society, including young adults

- Unemployment rate has increased across countries
- Remittance has dropped in many countries, affecting families dependent on this
- Family support and healthcare services are affected
- Elderly are more vulnerable due to pre-existing ill health

Number of deaths due to COVID-19 in England and Wales

Deaths by age and gender in March/April 2020, England and Wales

Leading causes of deaths in England and Wales 2020

Cause of deaths in England and Wales

Lessons learned from COVID-19 pandemic crisis

- COVID-19 is a complex problem in a complex system.
- Quarantine, spread, isolation, lockdown, masks, social distancing, hand hygiene, blood tests, vaccine, immunity: all these words are now part of our daily speech.
- Shaking the NHS (one of the best health system in the world).
- Lack of leadership, coordination, and mismanagement.
- Global pandemic needs integrated global response, but we see blame game among world leaders and international organization WHO.
- PPE shortage, protecting frontline healthcare workers, protecting elderly in residential and nursing care homes.
- Older people are very vulnerable and some die without necessary support and care.
- Families were shocked and helpless as they have lost their love one.

Post COVID-19 Challenges

- Pandemic trauma will continue for sometime among older people as they are the most at risk in the situation.
- Older people will need greater support in post-COVID era.
- Government, family, friends, relatives, and volunteering sector. Providing such support as before will be a big challenge.
- Uncertainty, tension, and paradox are inherent and must be accommodated rather than resolved.
- COVID-19 experience shifts from an acute national disaster to a chronic policy crisis.
- All clinicians, scientists, policy-makers, and citizens need to move on from imagining that the uncertainties can be resolved that they may never be.
(*Rutter et al. BMJ, 2020*)

Post COVID-19 Challenges

- Most countries will be fighting for the economic recovery in post-COVID-19.
- Worry is that elderly issues might get less priority.
- Adequate financing for elderly care will be a big challenging.
- Health and long-term care insurance will go up.
- There will be less trust and confidence on nursing care home services.
- Regaining a trust will be a big challenge in post-COVID era.
- Survivors needs additional mental health support as well.
- Many issues are now difficult to predict for the elderly.
- More research is needed to understand on this post-COVID era.

Conclusion

- Older people are affected most due to COVID-19.
- Over 90% of all deaths are among 60+ age group of people.
- Older males are in greater risk than females counterparts.
- Pre-existing health condition is a risk factor for COVID-19.
- The elderly became extremely vulnerable and isolated during the pandemic.
- Trust and confidence gap on care service providers and society.
- In post-COVID, older people will live with trauma and mental health problems. Finance to these would be a big challenge to a country.
